We have a motor which can be controlled by a PIC. But for that we need a microcontroller connected to the motor using a pulse-width-modulation (PWM). I want to control the motor using a pulse-frequency-modulation (PFM). This works great with a frequency from 100 to 100,000 Hz. But for higher frequencies, there is a switching of the current direction of the PWM signal. This switching is very fast and difficult to manage, because the frequency is so high. My question: Is there any influence of the switching on the reading of the magnetoresistance sensor? A: The PWM will not switch the current direction, it is just modulating a1d647c40b
