Make-A-Break allows users to create their own breakpoint key assignment. This features allows users to break on specific lines or characters. The program's UI is very simple, yet it is packed with features. It is available for Mac OS X 10.5+, Windows 2000, Windows 2003, and Windows XP. What is a Break Point? A break point is a point in your code where you want to insert some kind of debugging code in order to help you in troubleshooting an error and debug your code. Getting Started To make a breakpoint key assignment, you start by choosing

where to insert your break point. You can choose to insert it at a specific line of code or at a specific character position. You can also choose to insert it only at a specific time of execution. You can also choose to leave the break point at the same position between executions. Let's say you want to insert a break point in the middle of a function. You can leave the break point there between executions. How to Insert a Break Point You need to right-click to insert a break point. You can also left-click to enter the edit mode. After pressing on the break point icon, you are presented with a list of functions. You can decide whether you want to

break at the first function called or the last function called. You can also go to another location if the first option doesn't work. How to Set a Time Breakpoint This is the same as an idle break point. You can insert a time break point by pressing the 'Insert Break Point' button. You can also choose a specific number of seconds to break at. How to Delete a Break Point You need to select the break point. You can also press the Delete button. You can also delete all break points at once. You can insert a break point by pressing the 'Insert Break Point' button. Realistic, realistic, and Realistic. These are the three main properties that you

Take A Break is a simple tool that allows you to pause and resume your

activity on the computer. You can use this utility to stop the download of any kind of file (software, games, pictures, music, videos) after you've reached the destination, or to prevent the downloading of files entirely. The process is fast, as it doesn't need to run an installer or prepare any components on the system. More features include an option to let others know that the computer is temporarily paused. Features: - You can't activate more than one of this utility at a time; you can safely pause multiple downloads and resume the activity when you wish. - The application comes with a built-in scheduler that allows you to launch the

utility at a particular time. - It provides controls for the computer's media volume. - You can specify the necessary number of minutes for the pause to last. - Its interface is simple and easy to follow. - The application won't produce any files on your disk. - You can customize your settings via its advanced interface. - The application doesn't require installation. TakeABreak is a button collection made by some friends of mine and me. It's a collection of simple, but easy to use, standalone Mac screensavers. We have decided to publish it with Open Source License under 2 conditions: We want to show the applications to the community as an example of how to program a small application with Cocoa. If you are interested in helping us with programming this app, join us in the project thread. We would love to see more features implemented in this application, like for example, screen rotating or waking up the laptop or even

better, use Core Animation for the animations. Features of TakeABreak - Save you battery. - Save your time by running your screensaver only when you need it. - Screen Rotating option is available for your viewing pleasure. - Wake up your Mac by simple pressing the space bar. - Saves your Mac's battery. - Screen Saver, Standby, and On Battery Modes, all in one app. - Native Mac screensavers. - Full Cocoa codes. - User friendly interface. Requirements - Mac with Mac OS X 10.4 or later - 256 MB of memory recommended. - 10.5 MB of HD space is needed. Recommended Hardware Requirements - Mac running Mac OS X

a small and simple java tool, which can give you a preview of your homepage after you have visited it. It will show you how your current browser displays your home page, and it gives you an idea of how your browsers set the pages

up. TakeABreak is a small standalone Java tool. When you run it, it displays an image that is a copy of your home page, but is not stored locally on your computer. The image of your home page is rendered using Java. The image uses the Java ImageIO library to load the image and JPEG is used to format the image. You can examine the image, and even resize it to any size. You can then copy the image or use a browser that uses a "Save Image as" option to save the image. For any bugs and suggestions you may wish to contact the author of this tool. Sagescript or SagePub? SagePub (formerly SageWebb) is a commercial web-based

content management system that allows you to create, edit, and publish your own websites from within one interface. It was created to make it easier to create, test, and publish websites using SageXML, the de facto standard for XML content management. It supports both PHP and ASP.NET. SageWebb also supports the full range of SSI, FTP, CGI, and other server side web technologies to enable you to host your files in a web environment. You can host content on the Internet using a web hosting service such as your ISP. You can use your web host's web server, or use a web server hosting service, such as those offered

by MaxCDN, BigRock, or unlimitedbottle.com. SagePub is easy to install and deploy. For a list of the system requirements, see the installation documentation. For a list of installation instructions, see the user guide. For help using SagePub, please see the SagePub User Guide.
